

# SEC Financial Statement Data I

Our standard libraries:

```
In [1]: import pandas as pd
import requests
```

Main page: <https://www.sec.gov/dera/data/financial-statement-and-notes-data-set.html>

## Zip files

Link to most recent file:

```
In [2]: url = 'https://www.sec.gov/files/dera/data/financial-statement-and-notes-data-se'
```

We need these libraries to open the zip file:

```
In [3]: import zipfile
import io
```

```
In [4]: r = requests.get(url)
r
```

Out[4]: <Response [200]>

Did download work?

```
In [5]: if r.ok:
        print('good')
```

good

Unzip file:

```
In [7]: z = zipfile.ZipFile(io.BytesIO(r.content))
```

Get names of all the files in the zip folder:

```
In [8]: z.namelist()
```

```
Out[8]: ['sub.tsv',
        'tag.tsv',
        'dim.tsv',
        'ren.tsv',
        'cal.tsv',
        'pre.tsv',
        'num.tsv',
        'txt.tsv',
        'readme.htm',
        'notes-metadata.json']
```

Now we can open any of these files.

For example, open the numbers file:

```
In [9]: num = z.open( 'num.tsv' )
        num
```

```
Out[9]: <zipfile.ZipExtFile name='num.tsv' mode='r' compress_type=deflate>
```

Read this file:

```
In [10]: pd.read_table(num)
```

/Users/janschneider/opt/anaconda3/lib/python3.7/site-packages/IPython/core/interactiveshell.py:3147: DtypeWarning: Columns (12) have mixed types.Specify dtype option on import or set low\_memory=False.

interactivity=interactivity, compiler=compiler, result=result)

```
Out[10]:
```

	adsh	tag	version	ddate	qtrs

567320 rows × 16 columns

Which companies are these? → Open the submissions file:

```
In [11]: sub = z.open( 'sub.tsv' )
        pd.read_table(sub)
```

```
Out[11]:
```

3354 rows × 40 columns

Now let's save these files. You need to generate the following directory (folder) structure:

- current directory (where you run this notebook): folder "data"
- inside data folder: folder "sec"
- inside sec folder: folder "downloads"

This is where we save all file for 2020-12:

```
In [12]: period = '2020_12'
```

```
unzip_folder_name = 'data/sec/downloads/' + period
unzip_folder_name
```

Out[12]: 'data/sec/downloads/2020\_12'

Generate the directory '2020\_12' inside 'data/sec/downloads/':

```
In [13]: import os

if not os.path.exists(unzip_folder_name):
    os.mkdir(unzip_folder_name)           # Create directory for unzipped f
```

Save to this directory:

```
In [14]: z.extractall(unzip_folder_name)           # Unzip file into new directory
```

Structure of the URLs:

```
In [15]: 'https://www.sec.gov/files/dera/data/financial-statement-and-notes-data-sets/202
https://www.sec.gov/files/dera/data/financial-statement-and-notes-data-sets/202
https://www.sec.gov/files/dera/data/financial-statement-and-notes-data-sets/202
https://www.sec.gov/files/dera/data/financial-statement-and-notes-data-sets/202
```

Out[15]: 'https://www.sec.gov/files/dera/data/financial-statement-and-notes-data-sets/2020q2\_notes.zip'

Construct specific URL:

```
In [16]: period = '2020q1'

'https://www.sec.gov/files/dera/data/financial-statement-and-notes-data-sets/' +
```

Out[16]: 'https://www.sec.gov/files/dera/data/financial-statement-and-notes-data-sets/2020q1\_notes.zip'

Put all this into a function:

```
In [17]: def download_file(period):
url = 'https://www.sec.gov/files/dera/data/financial-statement-and-notes-dat

unzip_folder_name = 'data/sec/downloads/' + period

r = requests.get(url)
if r.ok:
    print('Downloaded:', url, 'to:', unzip_folder_name)
    if not os.path.exists(unzip_folder_name): os.mkdir(unzip_folder_name)
    z = zipfile.ZipFile(io.BytesIO(r.content))
    z.extractall(unzip_folder_name)
```

Now use the function like this (check your directory to make sure that the files got saved correctly:

In [18]:

```
download_file('2020_11')
```

Downloaded: [https://www.sec.gov/files/dera/data/financial-statement-and-notes-data-sets/2020\\_11\\_notes.zip](https://www.sec.gov/files/dera/data/financial-statement-and-notes-data-sets/2020_11_notes.zip) to: data/sec/downloads/2020\_11

In [19]:

```
download_file('2009q2')
```

Downloaded: [https://www.sec.gov/files/dera/data/financial-statement-and-notes-data-sets/2009q2\\_notes.zip](https://www.sec.gov/files/dera/data/financial-statement-and-notes-data-sets/2009q2_notes.zip) to: data/sec/downloads/2009q2

To download all files, we loop over all periods.

For example, all months in 2020:

In [59]:

```
for year in range(2020,2021):
    for month in range(1,13):
        period = str(year)+'_'+str(month)
        print(period)
```

```
2020_1
2020_2
2020_3
2020_4
2020_5
2020_6
2020_7
2020_8
2020_9
2020_10
2020_11
2020_12
```

Now run this cell to download all available files:

In [ ]:

```
for year in range(2010,2021):
    for quarter in [1,2,3,4]:
        period = str(year)+'q'+str(quarter)
        download_file(period)

for year in range(2020,2021):
    for month in range(1,13):
        period = str(year)+'_'+str(month)
        download_file(period)
```
